

3D Scanning Technology

Risk Management Built for the 21st Century:

At BRD, we're always looking for the next innovation or investment that helps us help you! It's why we've incorporated 3D scanning technology into our measuring process which gives us speed of design, and allows us to more easily document obstructions and solution interferences like associated electrical and conduit lines etc. Using this technology, we're able to provide pinpoint accuracy into our custom-engineered designs of the future. Like Jacob & Andrzej showcase below, our design team enjoys the benefits of complete 360° scanning, where we can analyze the jobsite from afar using lifelike 3D data of the jobsite, equipment and surrounding environment – providing our team with more efficient and complete data than ever before using non-contact, non-invasive technology. Modern problems require modern solutions!!
